

Amendments to the Claims:

This listing of claims replaces all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Currently amended) ~~In-Apparatus for a radio communication system having a first network and at least a second network permitting of mobile-node communications, said a mobile node operable to communicate data by way of a radio link with a fixed network, the mobile node associated with a home network provider that provides communication services for communication with the mobile node when the mobile node is positioned to communicate with a first portion of the fixed network, and the mobile node permitted mobility, selectably to be positioned to communicate with at least a second portion of the fixed network, communication services provided at the at least the second portion of the fixed network by at least one non-home network provider, an improvement of apparatus for facilitating determination of routing information by which to route the data pursuant to the mobile-node communications by way of any of communicated by the mobile node when positioned to communicate with any of the first and at least second networks, portions of the fixed network, said apparatus comprising:~~

a registration request detector adapted to receive indications of a registration request generated by the mobile node, said registration request detector for detecting values of the registration request;

at least a first table accessible at least responsive to detection by said registration request detector of the values of the registration request, said first table containing routing information indexed together with indicia associated with selected values of the registration request;

a routing determiner adapted selectably to receive indications of selected routing information contained in said at least the first table, said routing determiner, responsive at least in part to the routing information, for determining routing by which the data is to be communicated pursuant to the mobile-node communications by way of networks, free of

~~additional registration, by the mobile node, the routing determined by said routing determiner usable by the mobile node when positioned to communicate with the any of the first and at least second portions of the fixed network.~~

2. (Currently Amended) The apparatus of claim 1 wherein one of the first and at least second networks comprises a home network provider, and wherein the registration request said registration request detector is adapted to receive comprises identification of the home network provider with which the mobile node is associated and wherein the indicia associated with the selected values of the registration request indexed together in said first table comprises the identification of the home network provider

3. (Currently Amended) The apparatus of claim 2 wherein one of the first and at least second networks comprises a non-home network provider and wherein the registration request that said registration request detector is adapted to receive further comprises identification of the non-home ~~network network~~ provider ~~when the mobile node generates the registration request when positioned to communicate with the at least the second portion of the fixed network, and~~ wherein the routing determined by said routing determiner is further responsive to the identification of the non-home network provider.

4. (Original) The apparatus of claim 2 wherein the routing determined by said routing determiner is further responsive to the identification of the home network provider.

5. (Currently amended) The apparatus of claim 1 wherein ~~the network part of the radio communication system~~ further comprises a registration server, ~~to which the registration request formed by the mobile node is sent and wherein said registration request detector is embodied at the registration server, and wherein the registration request is delivered to the registration server.~~

6. (Original) The apparatus of claim 5 wherein said at least the first table and said routing determiner are embodied at the registration server.

7. (Currently amended) The apparatus of claim 1 further comprising a third network wherein the at least the second portion of the fixed network comprises the second portion and at least a third portion, wherein the second and third networks portions, respectively, encompass at least partially overlapping coverage areas, communication services provided at the second network portion by a first non-home network provider and communication services provided at the third network portion by a second non-home network provider, the routing determined by said routing determiner further responsive to whether roaming agreements are in place between at least one of the home network provider and with the first non-home network provider and the home network provider and the at least with the second non-home network provider.

8. (Currently Amended) The apparatus of claim 7 wherein the first network comprises a home network in which communication services are provided by a home network operator and wherein the routing determined by said determiner is further responsive to whether the agreements, if any, in place between the home network provider and the first non-home network provider and the home network provider and the at least the second non-home network provider, comprise bi-directional agreements.

9. (Currently amended) The apparatus of claim 1 wherein wherein the routing determined by said routing determiner comprises an internet protocol address to be used to address the data to be routed pursuant to the mobile-node communications ~~by the mobile node.~~

10. (Currently amended) The apparatus of claim 1 wherein the routing determined by said routing determiner comprises direct routing forming direct paths between at least a selected one of the at least the second ~~portion of the network part~~ and the first ~~portion of the network part~~.

11. (Currently Amended) The apparatus of claim 1 wherein the routing information indexed at said at least the first ~~table~~database together with the indicia associated with the selected values of the registration request comprise host routing information entries associated with ~~the home network provider~~of the mobile node.

12. (Original) The apparatus of claim 11 wherein the routing determined by said routing determiner includes, in part, the host routing information indexed together at said at least first table with the home network provider.

13. (Currently amended) The apparatus of claim 11 wherein at least one of the first network ~~part~~ and the second network ~~part~~ comprises a plurality of network parts ~~or sub-parts~~, wherein said at least first table further indexes together host routing information entries with the network parts ~~subparts~~ of the at least one of the first network part and the second network part.

14. (Currently Amended) The apparatus of claim 13 wherein the routing determined by said routing determiner includes, in part, the host routing information entries indexed together at said at least first table with the network parts ~~subparts~~ of the at least one of the first network part and the second network part.

15. (Currently Amended) ~~In a~~A method of communicating in a radio communication system having a first network and at least a second network permitting of mobile-node communications, ~~said mobile node operable to communicate data by way of a radio link with a fixed network, the mobile node associated with a home network provider that provides communication services for communication with the mobile node when the mobile node is positioned to communicate with a first portion of the fixed network, and the mobile node permitted mobility, selectably to be positioned to communicate with at least a second portion of the fixed network, communication services provided at the at least the second portion of the~~

~~fixed network by at least one non-home network provider, an improvement of a method for facilitating determination of routing information by which to route the data communicated pursuant to the mobile-node communications, by the mobile node when positioned to communicate with any of the first and at least second portions of the fixed network, said method comprising:~~

~~detecting values of a registration request generated by the mobile node;~~

~~accessing at least a first table to ascertain routing information indexed together with indicia associated with selected values of the registration request; and~~

~~determining routing by which the data is to be communicated pursuant to the mobile-node communications by way of by the mobile node, the routing usable by the mobile node when positioned to communicate with the any of the first and at least second networks, free of additional registration portions of the fixed network.~~

16. (Currently amended) The method of claim 15 wherein the registration request detected during said operation of detecting comprises identification of ~~a~~the home network provider with which the mobile node is associated and wherein the indicia associated with the selected values accessed during said operation of accessing comprise the identification of the home network provider.

17. (Currently amended) The method of claim 15 wherein the registration request detected during said operation of detecting comprises identification of ~~a~~the non-home network provider, ~~when the mobile node generates the registration request when positioned to communicate with the at least the second portion of the fixed network,~~ the routing determined during said operation of determining further responsive to the identification of the non-home network provider.

18. (Currently amended) The method of claim 15 further comprising a third network, +
~~wherein the at least the second portion of the fixed network comprises the second portion and at~~
~~least a third portion, wherein the second and third network portions, respectively, encompass at~~
least partially overlapping coverage areas, communication services provided at the second
network portion by a first non-home network provider and communication services provided at
the third network portion by a second non-home network provider ~~and communication services~~
~~provided at the third portion by a second non-home network provider, the routing determined~~
during said operation of routing further responsive to whether roaming agreements are in place
with ~~between at least one of the home network provider and the first non-home network provider~~
~~and the at least the~~ with the second non-home network provider.

19. (Currently amended) The method of claim 18 wherein the first network comprises a
home network in which communication services are provided by a home network operator, and
wherein the routing determined during said operation of determining routing is further
responsive to whether the roaming agreements, if any, in place between the home network
provider and the first non-home network provider and the home network provider and the at least
the second non-home network provider comprise bi-directional agreements.

20. (Original) The method of claim 15 wherein the fixed network comprises a
registration server and wherein said operations of detecting, accessing, and determining are
performed at the registration server.
